ProjectX

CLOUD & INFRASTRUCTURE · PILLAR OVERVIEW

A cloud you can be running on today.

Servers, storage, databases and Kubernetes from one catalog, across our own data centres and partner capacity we contract, with one API and one monthly invoice. Service providers can sell the same cloud under their own brand.

What it does

Provider-blind by construction
No provider's vocabulary reaches the platform or your customers. Moving a workload between clouds, or onto hardware you own, is a substrate change rather than a re-integration.

Residency decided before placement
Where a workload may run is settled by policy before a provider is chosen. Out-of-region provisioning is blocked, not flagged afterwards.

How it works

01 **Choose from one catalog** · Cloud console
Servers, storage, databases, Kubernetes and networking, ordered in minutes at a published price.

02 **Deploy where your policy allows** · Policy
Residency is decided before placement: a workload that may not leave a region cannot be placed outside it.

03 **Run it all on one invoice** · API
Every resource in every region draws down one credit balance and lands on one monthly invoice.

Products

Servers
Virtual and dedicated servers from one catalog.

Kubernetes
Managed clusters that name no upstream.

Object storage
S3-compatible buckets behind one endpoint.

Block storage
Volumes that attach, resize and snapshot.

Managed databases
One resource for every engine you run.

Networking
Private networks, load balancers and DNS, one rule model.

Backups
Retention tiers and cross-provider copies.

Questions buyers ask

Whose infrastructure does it run on?
Our own data centres and partner capacity we contract — presented as one catalog, so no provider's vocabulary ever reaches you or your customers.

How is data residency enforced?
Where a workload may run is settled by policy before a provider is chosen. An out-of-region placement is refused, not flagged afterwards.

What does it cost?
Every resource carries a published rate — per hour, per gigabyte, per request — and everything lands on one monthly invoice. The full rate card is on the pricing page.

Can we sell this cloud under our own brand?
Yes — service providers resell the same platform white-label, with their own pricing on top of the published rates.
