ProjectX

OPERATIONAL INTELLIGENCE · PILLAR OVERVIEW

The answer lives between the systems.

A semantic layer, decision workflows and governed agents that read across all four pillars — and act, under approval and full audit. This is the pillar that makes the other four worth having together rather than separately.

What it does

Cross-pillar correlation

A question spanning video, identity and data becomes one plan, authorized leg by leg in the pillar that owns each dataset. The answer shows the plan, the queries it generated and what was withheld.

A semantic layer over all five

Metrics defined once, with certification state, so two dashboards cannot disagree about what revenue means.

How it works

01 **Ask one question across everything** · Ask
A question spanning video, identity and data becomes one plan, authorized step by step in the pillar that owns each dataset.

02 **See the plan before anything runs** · Ask
Every answer shows its plan, the generated queries and the sources actually read — and what was withheld, and why.

03 **Act under approval and audit** · Console
Decision workflows and governed agents act on the answer, and every action is approved and on the record.

Products

Ask

Ask one question across every system, and see how it was answered.

Workflows & Agents

Automate the response, and keep every step accountable.

Questions buyers ask

What can we actually ask?
A question that spans pillars — footage, access records, tables — becomes one plan, authorized leg by leg in the pillar that owns each dataset.

Does it only answer, or can it act?
Both. Decision workflows and governed agents act on an answer, and every action runs under approval and lands on the audit chain.

Why trust the answer?
Every answer arrives with its plan, the generated queries, the sources actually read — and what was withheld, and why.

What does it cost?
Usage at published rates on the pricing page, on the same invoice as the rest of the platform.
